

Software Engineer – technical case

The case

Build a web-based application (and relevant infrastructure) to stream Twitter tweets to end-users in real-time using technologies of your choice. Submit the project as you deem appropriate and acceptable for colleagues.

General instructions

The assignment is supposed to be open and you're free to interpret it and make your own decisions and assumptions. It's up to you how much time you spend on the assignment, but you should deliver something that is appropriate to be used as a foundation for technical assessment and something you could pass on to a colleague.

We ask you to present the project and its code, architecture and thought process/decisions you took along the way during the technical interview with us.

Please send Adam (adam.bell-hanssen@coop.no), Jonas (jonas.blasas.lonnum@coop.no), and Felix (felix.hartmann@coop.no) the project link and password through GitHub or similar the latest one workday-ish ahead of the interview so we can prepare based on your solution.

If you have any technical questions about this task, please contact Adam through email. Other inquiries can be directed to Felix. Thank you for your time and effort in to this, we truly appreciate it! Good luck :)
